- **Cost of an implementation.** The only expensive step is the Kirchhoff solve. The paper points to nearly-linear-time Laplacian solvers (Spielman and Teng), to the correspondence between electrical networks and random walks (which would allow a fully decentralised solver), to auction algorithms, and to Baum's "knee-jerk" algorithm as possible relatives.
- The paper points to the correspondence between electrical networks and random walks (which would allow a fully decentralised solver), to auction algorithms, and to Baum's knee-jerk" algorithm as relatives, fine" and final" ones.
